Sturkey, David

**Abstract**—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 15 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of 30 minutes of moderate-intensity aerobic exercise. The control group consisted of 15 women who did not exercise. The HR and EE were measured at rest and during exercise at the beginning and end of the 10-week period. The results showed that the training program significantly increased the HR and EE of the subjects. The HR increased from 68 to 72 beats per minute at rest and from 148 to 152 beats per minute during exercise. The EE increased from 1,200 to 1,300 kcal per day at rest and from 2,400 to 2,600 kcal per day during exercise. The results suggest that a 10-week training program can improve the cardiovascular and metabolic health of sedentary, middle-aged women.
